Obstructive Sleep Apnea and Snoring

What Is Obstructive Sleep Apnea?

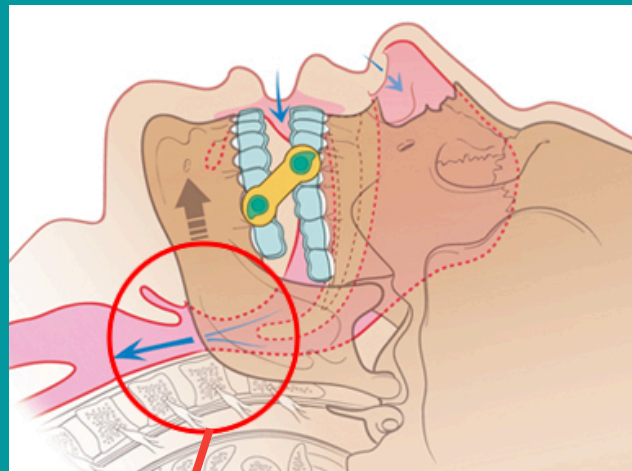

Obstructive sleep apnea (OSA) is a debilitating sleep related breathing for 10 seconds or more. During sleep, the body's muscles relax, causing the soft tissue of the airway to collapse which obstructs the airway. The body reacts to the closure of the airway by disrupting deep sleep in order to begin breathing again. This disruption prevents a restful night's sleep, negatively impacting one's health and well-being.

Snoring and Sleep Disruption

At least 80 million Americans snore, which is a sign of restricted airflow and impeded breathing during sleep. Snoring can adversely affect the sleep quality of the snorer's bed partner, contribute to excessive daytime sleepiness and diminish overall quality of life.

Closed airway obstructed by soft tissue

Open, free flowing airway with EMA Sleep Appliance

Simply Life-Changing

The EMA appliance fits entirely inside the mouth, is portable and allows the wearer to change sleep positions. In addition, there is no electricity or noise to potentially wake a sleeping partner. You can talk and drink water while wearing an EMA appliance, and the elastic straps can easily be changed at home.

EMA devices are FDA-cleared for the treatment of both obstructive sleep apnea and snoring, and are only available through dental professionals. EMA elastic straps are not made with natural rubber latex.
